

no · men · cla · ture

'nōmən, klāCHər/

noun

the devising or choosing of names for things, especially in a science or other discipline.

Why establish Nomenclature?

- We need governance over naming
- We need to create a common language to use cross-discipline
- We want to be consistent

Areas to Consider:

- Directory Structure
- AEM Structure
- Components (including how we classify Elements / Modules / Components)
- Details: naming structures should be considered in all aspects from content to asset creation, URLs, CSS, Javascript, etc.
- Documentation: it will be helpful to create a shorthand filenaming document for all to use as reference.

Questions for the team:

- Are components and content elements named to describe features or functions?
- How will we refer to variations of similar components, or on / off / hover states?
- How will we make names consistent across Content / Design / Development / UX?

Additional Thoughts:

- Who will be the owners (from each area above) of the filenaming?
- What possible filenaming limitations should we consider?
- Next steps?

Gracias!
